

#### NAME

App::Prove::State::Result - Individual test suite results.

## **VERSION**

Version 3.38

# **DESCRIPTION**

The prove command supports a --state option that instructs it to store persistent state across runs. This module encapsulates the results for a single test suite run.

# **SYNOPSIS**

```
# Re-run failed tests
$ prove --state=failed,save -rbv
```

#### **METHODS**

### **Class Methods**

#### new

```
my $result = App::Prove::State::Result->new({
    generation => $generation,
    tests => \%tests,
});
```

Returns a new App::Prove::State::Result instance.

# state\_version

Returns the current version of state storage.

# test\_class

Returns the name of the class used for tracking individual tests. This class should either subclass from App::Prove::State::Result::Test or provide an identical interface.

# generation

Getter/setter for the "generation" of the test suite run. The first generation is 1 (one) and subsequent generations are 2, 3, etc.

# last run time

Getter/setter for the time of the test suite run.

#### tests

Returns the tests for a given generation. This is a hashref or a hash, depending on context called. The keys to the hash are the individual test names and the value is a hashref with various interesting values. Each k/v pair might resemble something like this:

#### tast

```
my $test = $result->test('t/customer/create.t');
```

Returns an individual App::Prove::State::Result::Test instance for the given test name (usually the filename). Will return a new App::Prove::State::Result::Test instance if the name is not found.

### test names

Returns an list of test names, sorted by run order.

#### remove

```
$result->remove($test_name);  # remove the test
my $test = $result->test($test_name);  # fatal error
```

Removes a given test from results. This is a no-op if the test name is not found.

### num\_tests

Returns the number of tests for a given test suite result.

#### raw

Returns a hashref of raw results, suitable for serialization by YAML.
